## 3 ALLEYESONSCREENS DATA API

---

### 3.1 INTRODUCTION

AEOS solutions are based on its own, in-house developed AI and big data algorithms that enable a wide spectrum of marketing and data solutions. The application ranges from the synchronization of TV and digital advertising, optimization of programming schemes and campaign effectiveness to completely new addressable TV campaigns. Our solutions are used by more than 50 clients in 5 European countries from various groups such as advertisers, regulatory bodies, TV companies, media agencies and telecom operators.

1. We answer three crucial questions to enable a data-driven approach to TV advertising
2. Who is advertising what, how much and when?
3. What is being watched by audiences? How does this influence business KPIs?

Our data-driven models and analysis provides the answers to above questions.

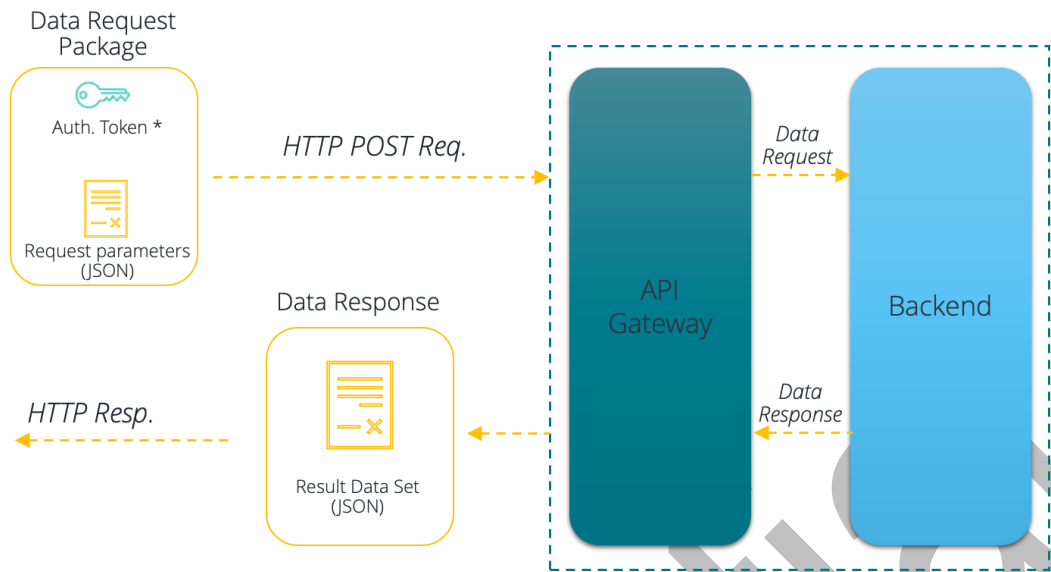

### 3.2 AEOS COCKPIT

A comprehensive dashboard integrating data from our own TV ad monitoring with proprietary audience measurement KPIs based on representative IPTV households. In addition to that, the cockpit has the ability to incorporate client-owned (e.g. sales, traffic) and third-party (e.g. weather) data streams in order to show correlations.

### 3.3 AEOS DATA API

APIs are the engine behind Cockpit product. The same APIs can be securely exposed to customers to provide greater flexibility and customization options. The APIs enable complex requests and provide data output which can be used for any kind of visualisation, reporting etc.

The basic API communication workflow is pictured below:

\* Session specific authentication & authorization token

Image 1. AEOS Data API collection workflow

The API is segmented into modules which have distinct functionalities.

- API Modules correspond to the modules available in the Cockpit.
- Target module is specified in the request package
- Each module has a specific list of request calls
- Request packet MUST contain JSON payload

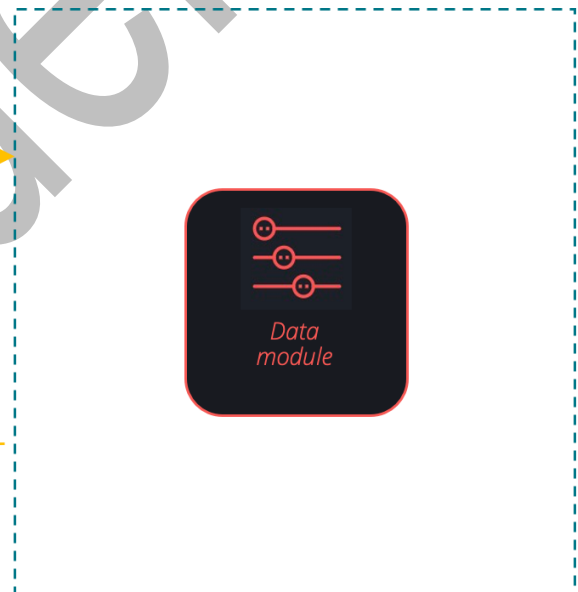

Image 2. AEOS Data API modules

## 4 API REFERENCE GUIDE

### 4.1 AUTH REQUEST

Each API communication session must start with “Auth Request”. The role of Auth request is to authenticate and authorize external user for API use. This is achieved using Customer-specific App Key in the Auth request, which then generates session based token used for API communication during that session. Each session has expiration timeout, after which re-authentication is needed.

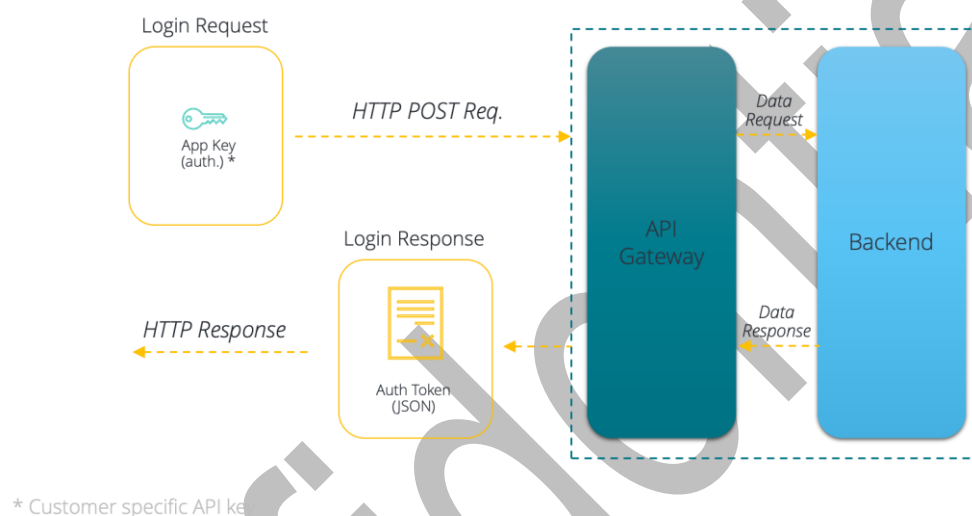

Image 3. AEOS AUTH request workflow

| REQUEST   | DATA (JSON PAYLOAD)  | TARGET                              |
|-----------|--|-------------------------------------|
| HTTP POST | <pre>{   "authparams": "[customer-specific api Key]",   "authmethod": "apikey",   "app": "apiv4" }</pre> | https://api.adscanner.tv/auth/login |

Table 1. AUTH request

| RESPONSE | DATA SUCCESS   | DATA FAIL                                    |
|----------|--|--|
| HTTP OK  | <pre>{   "refresh_token": "[refresh token string]",   "token": "[session security token]",   "code": 0,   "status": "New tokens generated" }</pre> | <pre>{ "error": "Invalid Parameters" }</pre> |

Table 2. AUTH response

#### EXAMPLE :

```
Curl --data '{"authparams":["customer-specific api Key"],"authmethod":"apikey","app":"apiv4"}'
https://api.adscanner.tv/auth/login
```

Auth JSON response includes **"token"** value, which needs to be used in every subsequent Data request made to API.

Sessions automatically expire after 600 seconds (10 minutes), regardless of the activity.

## 4.2 DATA REQUEST MODULES

Data request modules provides access to datasets in AEOS platform, based on request parameters. Each request can be tailored to fit the customer needs, in order to extract relevant data sets.

The request MUST include payload in JSON format, even if there are no parameters passed to the API. If no parameters are needed for the request, you must send empty JSON data: („{ }")

| REQUEST   | DATA   | TARGET   |
|-----------|--|--|
| HTTP POST | JSON data (see table below for individual request methods) | https://api.adscanner.tv/<br>APIv4/<helper report>/{ <b>METHOD</b> } |

Table 3. Data request – genral principle

{**METHOD**} defines functionality which is used for data retrieval. For list of methods available for please refer to chapter 4.3 Data request methods

| RESPONSE | DATA SUCCESS   | DATA FAIL                       |
|----------|--|---------------------------------|
| HTTP OK  | JSON data (see table below for individual request methods) | {"error": "Invalid Parameters"} |

Table 4. Data response – genral principle

### EXAMPLE:

```
curl --header "Authorization: Bearer {API token generated in Login step}" -X POST -H "Content-Type:application/json" -d "{JSON payload}" https://api.adscanner.tv/APIv4/<helper/report>/{METHOD}
```

Note: Authorization header must be constructed in the following way:

```
Authorization: Bearer {API session token}
```

The header contains word "Bearer", followed by single space and session token generated in Login step.

AEOS API uses two types of methods: Helper methods and Data request methods. Helper methods are used to pull metadata information (i.e. industry type, Company name, brand, product, etc.), which is then used to construct specific data retrieval request package. (i.e. Reach for specific advertising campaign in specific time period, reach for specific advertising industry type, etc.)

## 4.3 DATA REQUEST METHODS

### 4.3.1 INITIATEDEEPPANALYSISCHANNELEVENTREPORT

Method creates request for Channel Event report data from AEOS platform.

Request:

| PROPERTY         | TYPE         | DEFAULT VALUE | DESCRIPTION                          | REQUIRED  |
|------------------|--------------|---------------|--------------------------------------|---|
| "splitby"        | string       | "-1"          | time based data segmentation         | Yes (see table <i>Split by</i> for list of values)                                |
| "date_from"      | date         | -             | date format YYYY-MM-DD               | Yes   |
| "date_to"        | date         | .             | date format YYYY-MM-DD               | Yes   |
| "threshold"      | string       | "5sec"        | contact threshold                    | Yes (use default)   |
| "channels"       | string array | []            | limit data to channels (list of IDs) | Yes (can be empty)  |
| "profiles"       | string array | []            | limit data to profiles (list of IDs) | Yes (can be empty, see method <i>getProfiles</i> for full list)                   |
| "dayparts"       | string array | []            | limit data to dayparts               | Yes (can be empty, see method <i>getDayParts</i> for full list)                   |
| "variables"      | string array | ["reach (%)"] | Type of analysis                     | Yes (cannot be empty, use one or more of the values from table <i>Variables</i> ) |
| "showdataby"     | string       | "By Day"      | option for data grouping             | Yes (See table )  |
| "epg_categories" | string array | []            | list of IDs of EPG categories        | Yes (can be empty, see method <i>getEpgCategories</i> for list of IDs)            |

Table 5. *InitiateDeepAnalysisChannelEventReport* request properties

„Variables“ property values correspond to the same property available in Benchmark, Channel Performance and Deep Analysis section of the Cockpit. Table below lists all accepted values and types of reports

| VARIABLE    | USED IN   | DESCRIPTION   |
|-------------|---|---|
| "amr-perc"  | Channel / Event Analysis                          | Average percentage of households who have watched a specific event or day part.   |
| "reach (%)" | Channel / Event Analysis,<br>Advertising Analysis | Percentage of different households which have seen at least five seconds of a specific channel or an event.   |
| "reach-avg" | Channel / Event Analysis                          | Average daily RCH of selected period  |
| "share"     | Channel / event Analysis                          | Proportion of households viewing a specific channel, or a program, compared to the total number of households watching TV during the same interval of selected period.                      |
| "ats-avg"   | Channel / Event Analysis                          | Daily average number of minutes that household spent watching a specific channel or a program. Based on the reach of analysed Channel or Event  |
| "atv-avg"   | Channel / Event Analysis                          | Daily average number of minutes that household spent watching a specific channel or a program. The base includes all the households, those who are watching and those who are not watching. |
| "airings"   | Advertising Analysis                              | Total number of aired ads   |
| "xrp"       | Advertising Analysis                              | Exact Rating Point. AEOS version of the GRP: the sum of all Gross Rating Points (total contacts) based on individual contact  |
| "minutes"   | Advertising Analysis                              | Total duration of aired ads   |
| "spend"     | Advertising Analysis                              | Estimated cost per advertisement, cumulative for selected period  |

Table 6. "variables" values

„Split by“ property is used in the same way in the Cockpit, the function is to provide time segmentation of the resulting data set.

Table below lists all accepted values for property „splitby“ and types of reports

| SPLIT BY     | DESCRIPTION                                 |
|--------------|---|
| "-1"         | Default value. No specific time split used. |
| "1 second"   | Split data report by 1 second segments      |
| "1 minute"   | Split data report by 1 minute segments      |
| "5 minutes"  | Split data report by 5 minute segments      |
| "15 minutes" | Split data report by 15 minute segments     |
| "30 minutes" | Split data report by 30 minute segments     |
| "1 hour"     | Split data report by 1 hour segments        |

Table 7. "split\_by" values

„showdataby“ property is used in the same way in the Cockpit, the function is to provide time segmentation of the resulting data set.

Table below lists all accepted values for property „*showdataby*“ and types of reports

| SHOWDATABY          | DESCRIPTION  |
|---------------------|--|
| "By Day"            | Default value. Result dataset is split by day                  |
| "By weekday"        | Result dataset is aggregated by weekday                        |
| "By calendar week"  | Result dataset is aggregated by calendar week                  |
| "By calendar month" | Result dataset is aggregated by calendar month                 |
| "epgid"             | Result dataset is aggregated by EPG show                       |
| "period"            | Result dataset is aggregated across entire period, i.e. 7 days |

Table 8. "showdataby" values

Table below lists all accepted values for property „*groupby\_category*“ and types of reports

| GROUPBY_CATEGORY               | DESCRIPTION                                       |
|--------------------------------|---|
| "Industry overview"            | Result dataset is split by Industry               |
| "Category overview"            | Result dataset is split by Category               |
| "Subcategory overview"         | Result dataset is split by Subcategory            |
| "Company overview"             | Result dataset is split by Company                |
| "Brand overview"               | Result dataset is split by Brand                  |
| "Product overview"             | Result dataset is split by Products               |
| "Channel overview"             | Result dataset is split by Channels               |
| "Preferred placement overview" | Result dataset is split by placement in ad blocks |
| "Daypart overview"             | Result dataset is split by dayparts               |

Table 9. "groupby\_category" values

When a proper Data request package is created, it will return the Identifier of the report which must be used by getDeepAnalysisReportData method to fetch the results of the report.

Response:

| RESPONSE          | TYPE    | DESCRIPTION   |
|-------------------|---------|---|
| "status"          | String  | Status of report creation (true or false)                               |
| "report_id"       | Integer | ID of the report request  |
| "pending_reports" | Integer | Number of sent requests which have not yet started executing (in queue) |

|                   |         |   |
|-------------------|---------|---|
| "running_reports" | Integer | Number of reports executing at the moment |
|-------------------|---------|---|

Table 10. *InitiateDeepAnalysisChannelEventReport* response properties

Report data response format conforms to the following structure:

| PROPERTY | TYPE  | DESCRIPTION   |
|----------|-------|---|
| "body"   | array | Array of fields containing report data. Only values, no keys  |
| "header" | array | Array of fields containing column description data (key names corresponding to values in "body" property).<br>Each array item is a collection of key-value pairs. |

Table 11. *InitiateDeepAnalysisChannelEventReport* response properties

| PROPERTY  | TYPE    | DESCRIPTION  |
|-----------|---------|--|
| "key"     | string  | Header item, contains long name of data column       |
| "item"    | string  | Header item, contains short name of data column      |
| "format"  | string  | Header item, optional. Contains format of data field |
| "offset"  | integer | Header item, optional, internal use                  |
| "parent"  | string  | Header item, optional, internal use                  |
| "warning" | boolean | Header item, optional, internal use                  |

Table 12. *InitiateDeepAnalysisChannelEventReport* header response properties

### 4.3.2 INITIATEDEEPPANALYSISADVERTISINGREPORT

Method creates request for Channel Event report data from AEOS platform.

Request:

| PROPERTY    | TYPE         | DEFAULT VALUE | DESCRIPTION                          | REQUIRED  |
|-------------|--------------|---------------|--------------------------------------|---|
| "date_from" | date         | -             | date format YYYY-MM-DD               | Yes   |
| "date_to"   | date         | .             | date format YYYY-MM-DD               | Yes   |
| "channels"  | string array | []            | limit data to channels (list of IDs) | Yes (can be empty)  |
| "profiles"  | string array | []            | limit data to profiles (list of IDs) | Yes (can be empty, see method <code>getProfiles</code> for full list) |
| "dayparts"  | string array | []            | limit data to dayparts               | Yes (can be empty, see method <code>getDayParts</code> for full list) |

|                    |              |               |  |   |
|--------------------|--------------|---------------|--|---|
| "variables"        | string array | ["reach (%)"] | Type of analysis   | Yes (cannot be empty, use one or more of the values from table <i>Variables</i> ) |
| "frequency"        | string       | "1+"          | user interacted with the selected object (channel, ad, ...) at least once  | Yes (use default)   |
| "industries"       | string array | null          | list of IDs of industries  | Yes (can be <i>null</i> , see method <i>getIndustries</i> for list of IDs)        |
| "categories"       | string array | null          | list of IDs of categories  | Yes (can be <i>null</i> , see method <i>getCategories</i> for list of IDs)        |
| "subcategories"    | string array | null          | List of IDs of subcategories   | Yes (can be <i>null</i> , see method <i>getSubcategories</i> for list of IDs)     |
| "showdataby"       | string       | "By Day"      | option for data grouping   | Yes (See table )  |
| "epg_categories"   | string array | []            | list of IDs of EPG categories  | Yes (can be <i>empty</i> , see method <i>getEpgCategories</i> for list of IDs)    |
| "companies"        | string array | null          | list of IDs of companies   | Yes (can be <i>null</i> , see method <i>getCompanies</i> for list of IDs)         |
| "brands"           | string array | null          | list of IDs of Brands  | Yes (can be <i>null</i> , see method <i>getBrands</i> for list of IDs)            |
| "products"         | string array | null          | list of IDs of Products  | Yes (can be <i>null</i> , see method <i>getProducts</i> for list of IDs)          |
| "groupby_category" | string array | null          | Group output dataset by category   | Yes (can be <i>null</i> , see table for a list of available options)              |
| "placement"        | string       | "-1"          | Placement of ad in block: any, first or last, first two or last two, first three or last three, single ad block) | Yes ( values: "-1", "A-Z", "AB-YZ", "ABC-XZY", "S")                               |

Table 13. Initiate*DeepAnalysisAdvertisingReport* request properties

Response (report accepted for creation):

| RESPONSE          | TYPE    | DESCRIPTION   |
|-------------------|---------|---|
| "status"          | String  | Status of report creation (true or false)                               |
| "report_id"       | Integer | ID of the report request  |
| "pending_reports" | Integer | Number of sent requests which have not yet started executing (in queue) |
| "running_reports" | Integer | Number of reports executing at the moment                               |

Table 14. *initiateDeepAnalysisAdvertisingReport* response properties

When `report_id` is created with `"true"` status, the execution of the report can be followed using `getReportStatus` method.

Once report is finished, the data can be retrieved using `getDeepAnalysisReportData` method.

### 4.3.3 INITIATEADVERTISEMENTSPOTLISTREPORT

Method `"initiateAdvertisementSpotlistReport"` creates request for detailed list of advertisements aired on selected channel, filtered by selected parameters (i.e. industry, company, etc.) for selected time period. The resulting list contains all attributes available for each advertisement.

Request:

| PROPERTY                     | TYPE          | DEFAULT VALUE   | DESCRIPTION   | REQUIRED   |
|------------------------------|---------------|-----------------|---|--|
| <code>"channels"</code>      | integer array | <code>[]</code> | limit data to channels (list of IDs)  | Yes  |
| <code>"date_from"</code>     | date          | <code>-</code>  | date format YYYY-MM-DD  | Yes  |
| <code>"date_to"</code>       | date          | <code>.</code>  | date format YYYY-MM-DD  | Yes  |
| <code>"industries"</code>    | integer array | null            | limit data to industries (list of IDs)<br>Note: if <code>"industries"</code> , <code>"categories"</code> or <code>"subcategories"</code> properties are used, do not use <code>"companies"</code> , <code>"brands"</code> , or <code>"products"</code> properties   | No (remove if not used or use <code>null</code> value)<br>see method <code>getIndustries</code> for full list)                 |
| <code>"categories"</code>    | integer array | null            | limit data to categories. Must be used with appropriate value for <code>"industries"</code> property<br>Note: if <code>"industries"</code> , <code>"categories"</code> or <code>"subcategories"</code> properties are used, do not use <code>"companies"</code> , <code>"brands"</code> , or <code>"products"</code> properties                                   | No (remove if not used or use <code>null</code> value)<br>see method <code>getCategories</code> for full list per industry)    |
| <code>"subcategories"</code> | integer array | null            | limit data to subcategories. Must be used with appropriate values for <code>"industries"</code> and <code>"categories"</code> property<br>Note: if <code>"industries"</code> , <code>"categories"</code> or <code>"subcategories"</code> properties are used, do not use <code>"companies"</code> , <code>"brands"</code> , or <code>"products"</code> properties | No (remove if not used or use <code>null</code> value)<br>see method <code>getSubcategories</code> for full list per category) |
| <code>"companies"</code>     | integer array | null            | limit data to companies.<br>Note: if <code>"companies"</code> , <code>"brands"</code> , or <code>"products"</code> properties are used, do not use <code>"industries"</code> , <code>"categories"</code> or <code>"subcategories"</code> properties   | No (remove if not used or use <code>null</code> value)<br>see method <code>getCompanies</code> for list of companies           |
| <code>"brands"</code>        | integer array | null            | limit data to brands. Must be used with appropriate value for <code>"companies"</code> property   | No (remove if not used or use <code>null</code> value)   |

|            |               |      |   |  |
|------------|---------------|------|---|--|
|            |               |      | Note: if "companies", "brands", or "products" properties are used, do not use "industries", "categories" or "subcategories" properties  | see method <i>getBrands</i> for list of IDs per company  |
| "products" | integer array | null | limit data to brands. Must be used with appropriate value for "brands" property<br><br>Note: if "companies", "brands", or "products" properties are used, do not use "industries", "categories" or "subcategories" properties | No (remove if not used or use <i>null</i> value)<br><br>see method <i>getProducts</i> for list of IDs) |

Table 15. *initiateAdvertisementSpotlistReport* request properties

**Please note: if invalid combination of "companies", "brands" and "products" are used, the resulting data set will be empty. Same applies for "industries", "categories" and "subcategories".**

Response (report accepted for creation):

| RESPONSE          | TYPE    | DESCRIPTION   |
|-------------------|---------|---|
| "status"          | String  | Status of report creation (true or false)                               |
| "report_id"       | Integer | ID of the report request  |
| "pending_reports" | Integer | Number of sent requests which have not yet started executing (in queue) |
| "running_reports" | Integer | Number of reports executing at the moment                               |

Table 16. *initiateAdvertisementSpotlistReport* response properties

When report\_id is created with "true" status, the execution of the report can be followed using *getReportStatus* method.

Once report is finished, the data can be retrieved using *getDeepAnalysisReportData* method.

#### 4.3.4 INITIATE TOP TEN SPOTS

Method "initiateTopTenSpots" creates request for list of top 10 advertisements by XRP score aired on any channel which is monitored for advertising, in selected time period. Time periods are predefined to "Yesterday" (previous calendar day, from 00:00 until 23:59:59) or "Last 7 days" (7 days including previous calendar day until 23:59:59). The resulting list contains main attributes for each ad, including XRP score, Brand, total number of airings, Company and Product. The resulting list also includes a list of names of channels which are monitored for advertising.

Request:

| PROPERTY | TYPE   | DEFAULT VALUE | DESCRIPTION   | REQUIRED |
|----------|--------|---------------|---|----------|
| "period" | string |               | Accepted values: one of "Yesterday" and "Last 7 days" | Yes      |

Table 17. *initiateTopTenSpots* request properties

Response (report accepted for creation):

| RESPONSE          | TYPE    | DESCRIPTION   |
|-------------------|---------|---|
| "status"          | String  | Status of report creation (true or false)                               |
| "report_id"       | Integer | ID of the report request  |
| "pending_reports" | Integer | Number of sent requests which have not yet started executing (in queue) |
| "running_reports" | Integer | Number of reports executing at the moment                               |

Table 18. *initiateTopTenSpots* response properties

When report\_id is created with "true" status, the execution of the report can be followed using *getReportStatus* method.

Once report is finished, the data can be retrieved using *getReportData* method.

### 4.3.5 INITIATE TOP TEN EVENTS

Method "initiateTopTenEvents" creates request for list of top 10 events by Share, aired on any channel, in selected time period. Time periods are predefined to "Yesterday" (previous calendar day, from 00:00 until 23:59:59) or "Last 7 days" (7 days including previous calendar day until 23:59:59). The resulting list contains main attributes for each Event, including name of event, id in AEOS platform, airing start date and time, channel name, event category and Share percentage.

Request:

| PROPERTY | TYPE   | DEFAULT VALUE | DESCRIPTION                                   | REQUIRED |
|----------|--------|---------------|---|----------|
| "period" | string |               | Accepted values: "Yesterday" or "Last 7 days" | Yes      |

Table 19. *initiateTopTenEvents* request properties

Response (report accepted for creation):

| RESPONSE          | TYPE    | DESCRIPTION   |
|-------------------|---------|---|
| "status"          | String  | Status of report creation (true or false)                               |
| "report_id"       | Integer | ID of the report request  |
| "pending_reports" | Integer | Number of sent requests which have not yet started executing (in queue) |
| "running_reports" | Integer | Number of reports executing at the moment                               |

Table 20. *initiateTopTenEvents* response properties

When report\_id is created with "true" status, the execution of the report can be followed using *getReportStatus* method.

Once report is finished, the data can be retrieved using *getReportData* method.

#### 4.3.6 INITIATE TOP TEN CHANNEL

Method "initiateTopTenChannel" creates request for list of top 10 channels by Share, in selected time period. Time periods are predefined to "Yesterday" (previous calendar day, from 00:00 until 23:59:59) or "Last 7 days" (7 days including previous calendar day until 23:59:59). The resulting list contains name of channel, id in AEOS platform and Share percentage.

Request:

| PROPERTY | TYPE   | DEFAULT VALUE | DESCRIPTION                                      | REQUIRED |
|----------|--------|---------------|--|----------|
| "period" | string |               | Accepted values:<br>"Yesterday" or "Last 7 days" | Yes      |

Table 21. *initiateTopTenChannel* request properties

Response (report accepted for creation):

| RESPONSE          | TYPE    | DESCRIPTION   |
|-------------------|---------|---|
| "status"          | String  | Status of report creation (true or false)                               |
| "report_id"       | Integer | ID of the report request  |
| "pending_reports" | Integer | Number of sent requests which have not yet started executing (in queue) |

|                   |         |   |
|-------------------|---------|---|
| "running_reports" | Integer | Number of reports executing at the moment |
|-------------------|---------|---|

Table 22. *initiateTopTenChannel* response properties

When report\_id is created with "true" status, the execution of the report can be followed using *getReportStatus* method.

Once report is finished, the data can be retrieved using *getReportData* method.

### 4.3.7 GETREPORTSTATUS

Request:

| PROPERTY    | TYPE    | DESCRIPTION                           | REQUIRED |
|-------------|---------|---------------------------------------|----------|
| "report_id" | Integer | Unique identifier of requested report | Yes      |

Table 23. *getReportStatus* request properties

This method returns the status of creating the requested report, with details like report type, report start time, state, etc.

Response:

| RESPONSE       | TYPE     | DESCRIPTION  |
|----------------|----------|--|
| "report_id"    | Integer  | ID of the report request                                 |
| "report_name"  | String   | Type of the report                                       |
| "report_state" | string   | State of creation of report                              |
| "report_start" | datetime | Date and time of start of report creation, with timezone |
| "report_end"   | datetime | Date and time of completion of report, with timezone     |

Table 24. *getReportStatus* response properties

### 4.3.8 GETREPORTDATA

Request:

| PROPERTY    | TYPE    | DESCRIPTION                           | REQUIRED |
|-------------|---------|---------------------------------------|----------|
| "report_id" | Integer | Unique identifier of requested report | Yes      |

Table 25. *getReportData* request properties

Returns report data based on the request successfully created and confirmed. Response format depends on the type of report which was requested. If the report is still being created, the request returns the status of creating the report

Response (report in progress):

| RESPONSE    | TYPE    | DESCRIPTION               |
|-------------|---------|---------------------------|
| "status"    | String  | Status of report creation |
| "report_id" | Integer | ID of the report request  |

Table 26. *getReportData* response properties, report in progress

Report data response format conforms to the following structure:

| PROPERTY    | TYPE   | DESCRIPTION   |
|-------------|--------|---|
| "body"      | array  | Array of fields containing report data. Only values, no keys  |
| "header"    | array  | Array of fields containing respective column name and description for columns as they are presented in "body" property, following the order of columns<br>Each array item is a collection of key-value pairs. |
| "report_id" | string | ID of the report  |

Table 27. *getReportData* response properties, report completed

Header property can contain the following items:

| PROPERTY               | TYPE        | DESCRIPTION   |
|------------------------|-------------|---|
| "kpi"                  | string      | Header item, contains KPI parameters used                   |
| "title"                | string      | Header item, title of the report                            |
| "formats"              | string      | Header item, optional. Contains format of data fields       |
| "entities"             | integer     | Header item, list of entities used for filtering the report |
| "series_key_to"        | string      | Header item, optional, internal use                         |
| "report_created"       | datetime    | Header item, date and time of report creation               |
| "series_key_from"      | String      | Header item, optional, internal use                         |
| "time_frame_data"      | Date period | Header item, date period covered in the report              |
| "formatting_offset"    | Integer     | Header item, optional, internal use                         |
| "not_formatting_cells" | string      | Header item, optional, internal use                         |

Table 28. *getReportData* header response properties, report completed

```
curl --header "Authorization: Bearer {API token generated in Login step}" -X POST -H "Content-Type:application/json" -d '{"report_id": 10179945}' https://api.adscanner.tv/APIv4/report/getReportData
```

## 4.4 HELPER METHODS

### 4.4.1 GETINDUSTRIES

Request:

| PROPERTY | TYPE   | DESCRIPTION       | REQUIRED                  |
|----------|--------|-------------------|---------------------------|
| "filter" | string | filter text value | Yes (can be empty string) |

Table 29. *getIndustries* request properties

Returns a list of industries defined in AEOS platform. The list can be filtered by sending "filter" property in the request JSON. Filter can be empty string, in which case it will return all available industries.

Response:

| RESPONSE  | TYPE    | DESCRIPTION  |
|-----------|---------|--|
| "value"   | integer | ID of the Industry Object. 0 represents "Select all" |
| "caption" | string  | Name of the industry object                          |

Table 30. *getIndustries* response properties

#### EXAMPLE:

```
curl --header "Authorization: Bearer {API token generated in Login step}" -X POST -H "Content-Type:application/json" -d '{"filter":"pet"}' https://api.adscanner.tv/APIv4/helper/getIndustries
```

**RESPONSE:** [{"value": 0, "caption": "Select all"}, {"value": 19, "caption": "PET AND ANIMAL RELATED PRODUCTS"}]

### 4.4.2 GETCATEGORIES

Request:

| PROPERTY | TYPE   | DESCRIPTION               | REQUIRED                                |
|----------|--------|---------------------------|---|
| "filter" | string | filter text value         | Yes (can be empty string)               |
| "values" | array  | list of IDs of Industries | Yes (must include specific industry ID) |

Table 31. *getCategories* request properties

Returns a list of categories defined in AEOS platform, specific to selected industry or for all industries. The list can be filtered by sending “filter” property in the request JSON. Filter can be empty string, in which case it will return all available categories. The request MUST include “values” property, which cannot be empty.

Response:

| RESPONSE  | TYPE    | DESCRIPTION  |
|-----------|---------|--|
| “value”   | integer | ID of the Category Object. 0 represents “Select all” |
| “caption” | string  | Name of the Category object                          |

Table 32. *getCategories* response properties

**EXAMPLE:**

```
curl --header "Authorization: Bearer {API token generated in Login step}" -X POST -H "Content-Type:application/json" -d '{"filter":"alc","values":[2]}'
https://api.adscanner.tv/APIv4/helper/getCategories
```

**RESPONSE:** [{"value": 0, "caption": "Select all"}, {"value": 6, "caption": "Alcoholic Drinks"}, {"value": 16, "caption": "Non-alcoholic Drinks"}]

### 4.4.3 GETSUBCATEGORIES

Request:

| PROPERTY | TYPE   | DESCRIPTION               | REQUIRED                                |
|----------|--------|---------------------------|---|
| “filter” | string | filter text value         | Yes (can be empty string)               |
| “values” | array  | list of IDs of categories | Yes (must include specific category ID) |

Table 33. *getSubcategories* request properties

Returns a list of subcategories defined in AEOS platform, specific to selected category or for all categories. The list can be filtered by sending “filter” property in the request JSON. Filter can be empty string, in which case it will return all available subcategories. The request MUST include “values” property, which cannot be empty.

Response:

| RESPONSE  | TYPE    | DESCRIPTION   |
|-----------|---------|---|
| “value”   | integer | ID of the Subcategory Object. 0 represents “Select all” |
| “caption” | string  | Name of the Subcategory object                          |

Table 34. *getSubcategories* response properties**EXAMPLE:**

```
curl --header "Authorization: Bearer {API token generated in Login step}" -X POST -H "Content-Type:application/json" -d '{"filter":"alc","values":[6]}' https://api.adscanner.tv/APIv4/helper/getSubcategories
```

**RESPONSE:** [{"value": 0, "caption": "Select all"}, {"value": 9, "caption": "Alcoholic Drinks Group Advertising"}, {"value": 2, "caption": "Other Alcoholic Spirits"}, {"value": 7, "caption": "Beer Non-alcoholic"}]

#### 4.4.4 GETCOMPANIES

Request:

| PROPERTY | TYPE   | DESCRIPTION       | REQUIRED                  |
|----------|--------|-------------------|---------------------------|
| "filter" | string | filter text value | Yes (can be empty string) |

Table 35. *getCompanies* request properties

Returns a list of Advertiser companies defined in AEOS platform. The list can be filtered by sending "filter" property in the request JSON. Filter can be empty string, in which case it will return all available companies.

Response:

| RESPONSE  | TYPE    | DESCRIPTION                |
|-----------|---------|----------------------------|
| "value"   | integer | ID of the Company Object   |
| "caption" | string  | Name of the Company object |

Table 36. *getCompanies* response properties**EXAMPLE:**

```
curl --header "Authorization: Bearer {API token generated in Login step}" -X POST -H "Content-Type:application/json" -d '{"filter":"voda"}' https://api.adscanner.tv/APIv4/helper/getCompanies
```

**RESPONSE:** [{"value": 1798, "caption": "Vodafone"}]

#### 4.4.5 GETBRANDS

Request:

| PROPERTY | TYPE   | DESCRIPTION              | REQUIRED   |
|----------|--------|--------------------------|--|
| "filter" | string | filter text value        | Yes (can be empty string)                            |
| "values" | array  | list of IDs of companies | Yes (must include specific ID of the Company object) |

Table 37. *getBrands* request properties

Returns a list of brands defined in AEOS platform, specific to selected company. The list can be filtered by sending "filter" property in the request JSON. Filter can be empty string, in which case it will return all available brands. The request MUST include "values" property, which cannot be empty.

Response:

| RESPONSE  | TYPE    | DESCRIPTION                                       |
|-----------|---------|---|
| "value"   | integer | ID of the Brand Object. 0 represents "Select all" |
| "caption" | string  | Name of the Brand object                          |

Table 38. *getBrands* response properties

#### EXAMPLE:

```
curl --header "Authorization: Bearer {API token generated in Login step}" -X POST -H "Content-Type:application/json" -d '{"filter":"","values":["1798"]}' https://api.adscanner.tv/APIv4/helper/getBrands
```

**RESPONSE:** [{"value": 0, "caption": "Select all"}, {"value": 2522, "caption": "Fyve"}, {"value": 3723, "caption": "Otelos"}, {"value": 24674, "caption": "SIMon mobile"}, {"value": 2285, "caption": "Vodafone"}]

## 4.4.6 GETPRODUCTS

Request:

| PROPERTY | TYPE   | DESCRIPTION           | REQUIRED                     |
|----------|--------|-----------------------|------------------------------|
| "filter" | string | filter text value     | Yes (can be empty string)    |
| "values" | array  | list of IDs of brands | Yes (ID of the Brand object) |

Table 39. *getProducts* request properties

Returns a list of products defined in AEOS platform, specific to selected brand. The product is a specific advertising campaign which can include multiple different advertisements. The list can be filtered by sending "filter" property in the request JSON. Filter can be empty string, in which case it will return all available products. The request MUST include "values" property, which cannot be empty.

Response:

| RESPONSE  | TYPE    | DESCRIPTION   |
|-----------|---------|---|
| "value"   | integer | ID of the Product Object. 0 represents "Select all" |
| "caption" | string  | Name of the Product object                          |

Table 40. *getProducts* response properties

**EXAMPLE:**

```
curl --header "Authorization: Bearer {API token generated in Login step}" -X POST -H "Content-Type:application/json" -d '{"filter":"","values":[20544]}'
https://api.adscanner.tv/APIv4/helper/getProducts
```

**RESPONSE:** [{"value": 0, "caption": "Select all"}, {"value": 36152, "caption": "Tierschutzbund"} ]

## 4.4.7 GETCHANNELS

Request:

| PROPERTY    | TYPE    | DESCRIPTION  | REQUIRED |
|-------------|---------|--|----------|
| "analytics" | boolean | true: get list of analytics channels<br>false: get list of EPG/events channels | Yes      |

Table 41. *getChannels* request properties

Returns a list of channels defined in AEOS platform, including information if the channel is used for advertisement analysis or not. The list can be filtered by sending "filter" property in the request JSON. Filter can be empty string, in which case it will return all available channels.

Note: if "analytics" parameter is omitted, the returned list contains list of channels which can be used for EPG / Events analysis only. List of channels for Ad Analysis must be retrieved using "analytics": true parameter. Channel IDs are different for Ad analysis and EPG / Event analysis.

Response:

| RESPONSE  | TYPE    | DESCRIPTION                                  |
|-----------|---------|--|
| "value"   | integer | ID of the Channel. 0 represents "Select all" |
| "caption" | string  | Name of the Channel                          |

|             |         |   |
|-------------|---------|---|
| "analytics" | boolean | true: advertisement analytics available |
|-------------|---------|---|

Table 42. *getChannels* response properties**EXAMPLE:**

```
curl --header "Authorization: Bearer {API token generated in Login step}" -X POST -H "Content-Type:application/json" -d '{"analytics": false}' https://api.adscanner.tv/APIv4/helper/getChannels
```

**RESPONSE:** [{"value": 153, "caption": "DAS ERSTE","analytics": true},{ "value": 864, "caption": "ZDF","analytics": true},...,{ "value": 868, "caption": "ZDFneo","analytics": false}]

## 4.4.8 GETEPGCATEGORIES

Request:

| PROPERTY | TYPE   | DESCRIPTION       | REQUIRED                 |
|----------|--------|-------------------|--------------------------|
| "filter" | string | filter text value | No (can be empty string) |

Table 43. *getEpgCategories* request properties

Returns a list of EPG (tv guide) categories defined in AEOS platform. The list can be filtered by sending "filter" property in the request JSON. Filter can be empty string, in which case it will return all available channels.

Response:

| RESPONSE  | TYPE    | DESCRIPTION  |
|-----------|---------|--|
| "value"   | integer | ID of the EPG category Object. 0 represents "Select all" |
| "caption" | string  | Name of the EPG category object                          |

Table 44. *getEpgCategories* response properties**EXAMPLE:**

```
curl --header "Authorization: Bearer {API token generated in Login step}" -X POST -H "Content-Type:application/json" -d '{"filter": "tal"}' https://api.adscanner.tv/APIv4/helper/getEpgCategories
```

**RESPONSE:** [{"value": 10, "caption": "Talkshow"}]

## 4.4.9 GETPROFILES

Returns a list of viewer segments, which are created by analyzing viewing behavior.

Response:

| RESPONSE   | TYPE    | DESCRIPTION                                      |
|------------|---------|--|
| "value"    | integer | ID of the Profile object.                        |
| "caption"  | string  | Name of the Profile object                       |
| "hidden"   | boolean | true: the profile is hidden in the Cockpit       |
| "disabled" | boolean | true: the profile cannot be used in data request |

Table 45. *getProfiles* response properties

### EXAMPLE:

```
curl --header "Authorization: Bearer {API token generated in Login step}" -X GET -H "Content-Type:application/json" -d '' https://api.adscanner.tv/APIv4/helper/getProfiles
```

**RESPONSE:** [{"caption": "CASUALS","value": 1, "hidden": false, "disabled": false}, {"caption": "REAL TV FANS","value": 2, "hidden": false, "disabled": false}, ..., {"caption": "TENNIS","value": 66, "hidden": false, "disabled": false}]

## 4.4.10 GETUSERDATEINTERSECT

Returns date range of available data for the user running the request. If the user in data request uses date range outside of this range, it will be limited to this range.

Response:

| RESPONSE     | TYPE  | DESCRIPTION  |
|--------------|-------|--|
| "date_range" | array | array containing 2 values: start date and end date |

Table 46. *getUserDateIntersect* response properties

### EXAMPLE:

```
curl --header "Authorization: Bearer {API token generated in Login step}" -X GET -H "Content-Type:application/json" -d '' https://api.adscanner.tv/APIv4/helper/getUserDateIntersect
```

**RESPONSE:** {"date\_range" : ["2021-01-01", "2021-12-30"]}

#### 4.4.11 GETDAYPARTS

Returns list of predefined dayparts which can be used in data requests.

Response:

| RESPONSE  | TYPE   | DESCRIPTION                 |
|-----------|--------|-----------------------------|
| "value"   | string | ID of the Day part object   |
| "caption" | string | Name of the Day part object |

Table 47. *getDayParts* response properties

##### EXAMPLE:

```
curl --header "Authorization: Bearer {API token generated in Login step}" -X GET -H "Content-Type:application/json" -d '' https://api.adscanner.tv/APIv4/helper/getDayParts
```

**RESPONSE:** [{"caption" : "6 - 9", "value" : "6 - 9"}, {"caption" : "9 - 11", "value" : "9 - 11"}, {"caption" : "11 - 13", "value" : "11 - 13"}, {"caption" : "13 - 17", "value" : "13 - 17"}, {"caption" : "17 - 20", "value" : "17 - 20"}, {"caption" : "20 - 23", "value" : "20 - 23"}, {"caption" : "23 - 0", "value" : "23 - 0"}, {"caption" : "0 - 3", "value" : "0 - 3"}, {"caption" : "3 - 6", "value" : "3 - 6"}]

## 5 DEPRECATED METHODS

Deprecated methods are scheduled to be removed from use in the next iteration of AEOS API update. We strongly urge all AEOS API customers to migrate all processes to new methods as soon as you are informed of deprecation, because AEOS cannot guarantee duration of availability of deprecated methods.

### 5.1 LIST OF DEPRECATED METHODS

#### 5.1.1 GETADVERTISEMENTSPOTLISTREPORT

Method "getAdvertisementSpotlistReport" provides a detailed list of advertisements aired on selected channel, filtered by selected parameters (i.e. industry, company, etc.) for selected time period. The resulting list contains all attributes available for each advertisement.

Request:

| PROPERTY     | TYPE         | DESCRIPTION   | REQUIRED   |
|--------------|--------------|---|--|
| "date_from"  | string       | start date for report   | No (can be <i>null</i> value)  |
| "date_to"    | string       | end date for report   | No (can be <i>null</i> value)  |
| "variable"   | string       | KPIs to be included in the report   | Yes ( please use values defined in table "variables")  |
| "channel"    | integer      | id of the channel for data report. Please use <code>getChannels</code> helper method for list of all channels and IDs               | Yes (must contain valid channel ID)  |
| "brands"     | string array | ids of the brand(s) for data report. Please use <code>getBrands</code> helper method for list of all brands and their IDs           | No (can be sent as empty array)  |
| "dayparts"   | string array | dayparts selection for data report. Please use <code>getDayParts</code> helper method for list of all day parts                     | No (can be sent as empty array)  |
| "weekday"    | String array | Filter report based on weekdays   | No (can be sent as empty array)  |
| "restrictby" | string       | If dayparts, weekdays or <code>epg_categories</code> are used for filtering, must be used   | No (null or if weekday, dayparts or EPG categories are used for filtering, this parameter must be used. Values: "dayparts", "weekday", "epg_categories") |
| "companies"  | string array | ids of the company(ies) for data report. Please use <code>getCompanies</code> helper method for list of all companies and their IDs | No (can be sent as empty array)  |
| "products"   | string array | ids of the brand(s) for data report. Please use <code>getProducts</code> helper method for list of all products and their IDs       | No (can be sent as empty array)  |
| "industries" | string array | ids of the brand(s) for data report. Please use <code>getIndustries</code> helper method for list of                                | No (can be sent as empty array)  |

|                  |              |   |                                 |
|------------------|--------------|---|---------------------------------|
|                  |              | all industries and their IDs  |                                 |
| "categories"     | string array | ids of the brand(s) for data report. Please use <code>getCategories</code> helper method for list of all categories and their IDs       | No (can be sent as empty array) |
| "subcategories"  | string array | ids of the brand(s) for data report. Please use <code>getSubcategories</code> helper method for list of all subcategories and their IDs | No (can be sent as empty array) |
| "epg_categories" | integer      | Ids of the epg_categories for data report.  |                                 |

Table 48. *getAdvertisementSpotlistReport* request properties

The request returns list of all ads aired in selected time period, filtered by request parameters. Please be aware that if mutually excluding properties are included in the request, the result will be an empty data set (i.e. selected company does not correspond to selected product)

The table below lists all response attributes and their description:

| ATTRIBUTE                | DESCRIPTION   |
|--------------------------|---|
| <i>No</i>                | Number of the Ad in the list  |
| <i>Occ_id</i>            | Occurance ID of the ad (AEOS internal)  |
| <i>Add_id</i>            | ID of the Ad (AEOS internal)  |
| <i>Duration</i>          | Duration of the ad (in seconds)   |
| <i>Company</i>           | Advertiser Company name. List of all companies can be retrieved using <code>getCompanies</code> helper method                             |
| <i>Brand</i>             | Advertiser brand. List of all brands can be retrieved using <code>getBrands</code> helper method  |
| <i>Product</i>           | Advertised product. List of all products can be retrieved using <code>getProducts</code> helper method                                    |
| <i>Claim</i>             | Clain of the advertisement  |
| <i>ADScanner ID</i>      | AEOS internal ID  |
| <i>Airing date</i>       | Date of the occurance airing  |
| <i>Airing day</i>        | Day of the occurance airing (name)  |
| <i>Airing time</i>       | Time of the occurance airing (hh:mm:ss)   |
| <i>Airing daypart</i>    | Daypart of the occurance airing. List of available dayparts can be retrieved using <code>getDayParts</code> helper method                 |
| <i>EPG category</i>      | EPG category within the ad was aired. List of available EPG categories can be retrieved using <code>getEpgCategories</code> helper method |
| <i>EPG name</i>          | Name of the programming   |
| <i>Position in block</i> | positioning of the ad block in relation to the programming, based on EPG data   |
| <i>Industry</i>          | Relevant industry of the ad. List of available industries can be retrieved using <code>getIndustries</code> helper method                 |

|                              |  |
|------------------------------|--|
| <i>Category</i>              | Relevant category of the ad. List of all categories can be retrieved using <code>getCategories</code> helper method  |
| <i>Subcategory</i>           | Relevant subcategory of the ad. List of all subcategories can be retrieved using <code>getSubcategories</code> helper method   |
| <i>Country</i>               | Airing in which country  |
| <i>Channel</i>               | Channel where the ad was aired. List of available channels can be retrieved using <code>getChannels</code> helper method   |
| <i>Placement in block</i>    | Relative placement in the block of ads. "S" denotes single ad, "A", "B", "C" relative order from 1 <sup>st</sup> ad, "M" any add after 3 <sup>rd</sup> ad, "X", "Y", "Z" last 3 ads in the block |
| <i>First or last</i>         | explicit indication if the ad is "First" or "Last". In case of single ad in block, always marked as "First"  |
| <i>Ads in block</i>          | Number of ads in the block   |
| <i>Ad block duration</i>     | total duration of ad block in mm:ss  |
| <i>Ad block net duration</i> | net duration of ad block (sum of all ads duration)   |
| <i>Ad block id</i>           | Ad block ID (AEOS internal)  |
| <i>XRP</i>                   | Exact rating point of the ad during airing   |
| <i>Spend</i>                 | Gross price of the advertisement, based on channels pricelist  |

Table 49. `getAdvertisementSpotlistReport` export list of attributes**EXAMPLE:**

```
curl --header "Authorization: Bearer {API token generated in Login step}" -X POST -H "Content-Type:application/json" -d @request.json https://api.adscanner.tv/APIv4/report/getAdvertisementSpotlistReport
```

```

### 5.1.2 GETDEEPANALYSISREPORTDATA

Request:

| PROPERTY    | TYPE    | DESCRIPTION                           | REQUIRED |
|-------------|---------|---------------------------------------|----------|
| "report_id" | Integer | Unique identifier of requested report | Yes      |

Table 50. *getDeepAnalysisReportData* request properties

Returns report data based on the request successfully created and confirmed. Response format depends on the type of report which was requested. If the report is still being created, the request returns the status of creating the report

Response (report in progress):

| RESPONSE    | TYPE    | DESCRIPTION               |
|-------------|---------|---------------------------|
| "status"    | String  | Status of report creation |
| "report_id" | Integer | ID of the report request  |

Table 51. *getDeepAnalysisReportData* response properties, report in progress

Report data response format conforms to the following structure:

| PROPERTY | TYPE  | DESCRIPTION   |
|----------|-------|---|
| "body"   | array | Array of fields containing report data. Only values, no keys  |
| "header" | array | Array of fields containing respective column name and description for columns as they are presented in "body" property, following the order of columns<br><br>Each array item is a collection of key-value pairs. |

Table 52. *getDeepAnalysisReportData* response properties, report completed

Header property can contain the following items:

| PROPERTY  | TYPE    | DESCRIPTION  |
|-----------|---------|--|
| "key"     | string  | Header item, contains long name of data column       |
| "item"    | string  | Header item, contains short name of data column      |
| "format"  | string  | Header item, optional. Contains format of data field |
| "offset"  | integer | Header item, optional, internal use                  |
| "parent"  | string  | Header item, optional, internal use                  |
| "warning" | boolean | Header item, optional, internal use                  |

Table 53. *getDeepAnalysisReportData* header response properties, report completed

Confidential
